

RSA enVision® Platform

Security Overview

At a Glance

- Provides 100 percent visibility into all security threats across your entire information infrastructure
- Captures *All the Data™* from network, security, host, application and storage layers across the enterprise
- Analyzes both real-time and historical data and presents information in views and reports

Customer Objective

Even the best perimeter defenses cannot stop all of today's external security threats, and they are virtually useless against internal threats. To truly secure your information infrastructure, you need to know exactly what is happening across your entire network and IT infrastructure, all of the time.

The RSA enVision® Platform provides the only security information and event management solution that delivers 100 percent visibility into all security threats across your entire information infrastructure — from switches and routers, to security devices, host assets, applications, servers and storage. The Platform accomplishes this through the real-time aggregation and analysis of *All the Data* from all networked elements in its LogSmart Internet protocol database (IPDB). With the use of The Platform's baseline learning system, you can see exactly what usual — or unusual — patterns are forming on your network, enabling you to identify security threats literally anywhere in your network, even in remote locations.

RSA enVision® Platform: Security Solutions

Complexity is the enemy of security. And today, most enterprise security infrastructures are incredibly complex, with large numbers of disparate security systems distributed throughout the network. RSA enVision® Platform provides security solutions that radically simplify security management by consolidating, normalizing and analyzing data from this complex infrastructure. For customers, this significantly improves security effectiveness because they can respond faster to external threats, and uncover internal ones by gaining unified and comprehensive visibility over their networks.

The RSA enVision Internet Protocol Database

Using its advanced LogSmart IPDB architecture that is deployed in hundreds of enterprises world-wide, RSA enVision is able to capture *All the Data* from network, security, host, application and storage layers across the enterprise. LogSmart IPDB analyzes both real-time and historical data and presents information in views and reports designed to meet the far-ranging needs of everyone in your organization — from the IT department, to the security department, to the compliance and risk officers and executive management.

The benefits of LogSmart IPDB include:

- Designed to store and work efficiently with unstructured data natively without any filtering or data normalization
- Maintains a digital chain of custody for all data which assures that once data is committed to the database, it can never be altered — unlike most data schemas used in RDBMS-based solutions
- No agents are required
- Distributed peer-to-peer architecture enables high scalability and performance

The Security Division of EMC

Through the LogSmart IPDB, the RSA enVision Platform enables customers to radically improve their security posture through:

- Access-Control Enforcement — Comprehensive auditing and reporting capabilities to enforce access-control policies enable customers to immediately detect when misuse occurs and enforce accountability for both privileged and non-privileged access to network, computing and object-level components.
- False Positive Reduction — The automatic correlation of reported attacks to asset and vulnerability data significantly reduces incident-handling costs and enables critical security-analysis resources to concentrate on serious events of interest.
- Real-Time Monitoring — A unified view into the relationships of the events occurring across the enterprise greatly enhances customer practices that have been defined and built around the continuous real-time monitoring of network, system and security-event information, enabling users to immediately determine “what is happening” across the enterprise.
- Unauthorized Network Service Detection — The detection of rogue services that utilize “open paths” through network defenses enables customers to shut down network access that would otherwise lead to information leakage, privacy liabilities and illegal content transfer across the enterprise.
- Watchlist Enforcement — Parameterized event and alert analysis provides significant operational efficiencies and enables customers to determine their external and internal risk exposures to offenders, who are identified

by network addresses and user names that target specific service and systems in the enterprise.

- Correlated Threat Detection — The goal of enterprise-wide security becomes a realization through the automated process of examination of network, security and system events in terms of vulnerability, risk and threat assessments across all enterprise locations.

About RSA

RSA, The Security Division of EMC, is the expert in information-centric security, enabling the protection of information throughout its lifecycle. RSA enables customers to cost-effectively secure critical information assets and online identities wherever they live and at every step of the way, and manage security information and events to ease the burden of compliance.

RSA offers industry-leading solutions in identity assurance & access control, encryption & key management, compliance & security information management and fraud protection. These solutions bring trust to millions of user identities, the transactions that they perform, and the data that is generated. For more information, please visit www.RSA.com and www.EMC.com.
